

MoM: Meet - 2

31 January 2026

MEETING DEBRIEF:

- The submitted demonstration video on the CLI version of a basic workflow was reviewed. Certain points were highlighted regarding the basic workflow and major point-out was to include voice-overs for upcoming demo videos, if any.
- The current pipeline uses a variant of the QA model - DistilBERT that answers questions for each field by scanning the entire conversation. The client suggests moving away from cosine-similarity based models.
- Background research on plausible models to improve the workflow is expected to have started by the next meeting. Preprocessing of the chats fed by the user is to be handled, if and when necessary.
- The client wishes to be kept in the loop through messages/shared documentation.
- An emphasis on middle ground between large multi-functionality and small good-enough models is to be maintained for practicality purposes.

EXPECTED DELIVERABLES: (PHASE 0 - v2)

- Integrate the current pipeline into a simple wireframe-UI that is intuitive.
- Allow the user to add forms and make scope for the pipeline to generate questions to be fed to the model being used (if updated).
- Allow the user to type out a conversation in a format of choice or dump a text paragraph to transcribe for the form filling application.
- Add a summarizer block, right before the form is filled for user clarity. Intent identification can be done at this step, purpose currently unclear.
- Make detailed log files for all operations and save to the database. Allow the admins to pull log files for necessary purposes.
