

Project Synopsis/Project Concept Document

(Due: 25th January)

Project Title	<i>Chat-based Form Filling</i>
TA Mentor	<i>Aman Uniyal</i>
Document	DASS Project Concept Document
Creation date	<i>21st January, 2026</i>
Version History	v0.1.0 (This is the first version of this document following the start of the project)
Created By	Kausheya Roy Hari Aakash, Hemang Joshi, Neha Prabhu, Shuban Biswas
Client	<i>Satish Kathirisetti and Akhila Venigalla, IITH - Product Labs</i>

Description

Manually filling out forms is error-prone, time consuming and repetitive. This issue is more evident in real-world use where users may want to provide inputs verbally rather than by typing. They might also want to stop midway and continue filling the form later without losing context.

The problem being addressed is the lack of an intelligent flexible system that can dynamically capture user input through real-time text or audio streams and map that input directly to the relevant form fields.

At a conceptual level, the goal is to bridge the gap between natural human communications and rigid digital form interfaces.

Profile of Users

The system will be used by administrators, data entry personnel, and employees across different organizations, as the application is domain-agnostic.

Administrators manage the system configuration. They create and modify form templates, define fields, and they are typically comfortable with technology and require flexible configuration, access control, and system reliability.

Data entry personnel use the system intensively to fill large volumes of forms. Speed, accuracy, and minimal manual effort are critical for them. They are likely to rely on real-time text or audio input, so the interface must be fast, clear, and easy to correct.

Employees/end users provide information for forms as part of their regular work. Their technical skills may vary, and they may prefer voice input. The system must be simple, intuitive, and allow pausing and resuming form completion.
