

MoM: Meet - 4

19 February 2026

MEETING DEBRIEF:

- Reviewed the current UI and live data extraction workflow. The client provided feedback that the current UI layout requires refinement to be more intuitive, specifically noting that the buttons are currently too large.
- Discussed dataset preparation for the upcoming chunking model. The team is currently generating diverse conversation cases and data types using Gemini calls to train the Gemma functional model.
- The architecture diagram for the pipeline was shared and discussed.
- Clarified the form filling logic: instead of scanning the entire conversation to answer a specific form question, the pipeline takes an answer/statement and determines which form field it optimally fits into.
- A major architectural decision was made to strictly separate the **Intent Identification** model from the **Form Filling** model. The intent identification should act as a high level summarizer that captures the core intent of the conversation independently of any specific form fields.
- For processing long streams of input (eg, lengthy documents or continuous live audio), the intent model should chunk the data with overlapping sections to preserve context, extract the intent per chunk, and store the vectors in a persistent database. This prevents the need to retrain the form filling model for different lengths of text.

EXPECTED DELIVERABLES:

- Fix the UI/UX issues to ensure the interface is clean, properly scaled, and easy to navigate.
- Complete the fine tuning of the Gemma SLM for form field extraction.
- Integrate the independent intent identifier module into the pipeline.

TIMELINE:

- An interim meeting is scheduled for **Tuesday, 24 February 2026, at 5:00 PM** to review the modeling progress and finalized architecture.
- The client will be unavailable for the following week; standard meetings are expected to resume around **12 March 2026**.
